ABSTRACT: The purpose of this study was to determine the effect of a 12-week resistance training program on the strength and endurance of the lower extremities in healthy young adults. The subjects were 15 male and 15 female college students, aged 18 to 25 years, who were randomly assigned to either a resistance training group or a control group. The resistance training group performed a 12-week program of resistance training, while the control group performed no exercise. The subjects were tested at baseline and at 12 weeks for strength and endurance. The results showed that the resistance training group had significantly greater strength and endurance than the control group at 12 weeks. The findings suggest that a 12-week resistance training program can improve the strength and endurance of the lower extremities in healthy young adults. *J Strength Cond Res 19(1):1-6, 2005*

On April 22, 2001, MEH LINN was interviewed. She stated that she did not know the person who was arrested on 4/19/01.

MEDLINE abstracts in the 1997, 1998, and 1999 files incorporate the MeSH 2001 vocabulary. Please email info@pubmed.gov for details.

16 **NELL-1** enhances mineralization in fetal calvarial osteoblastic

cells.

Leemaker,

Michael T.; Ting, Kang

AB The expression of **NELL-1** expression with bone formation and

mineralization of the calvarial osteoblast-like cells was studied.

NELL-1 mRNA was faintly expressed from day 14 of gestation with

marked increase over the postnatal period. Both primary rat fetal

calvarial

cell cultures and MC3T3 cell cultures overexpressing **NELL-1**

showed an increase in mineralization. Mouse cDNA array results from

NELL-1-infected MC3T3 cells showed the expression modulation of

the genes related to bone formation and craniofacial development:

down-regulation in BMP-2 gene expression and upregulation of Split Band

and

Foot genes.
